

Grapple for Forklift

Forklift Grapple - Grapples work along with the crowning operation of the bucket cylinder situated on the excavator. They can mount directly onto the jib or whatever quick hitch that is in bucket position. Grapples are usually meant for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design offers the grapple with maximum support and strength by preventing the body from breaking and twisting through its function.

The grapple along with all of its moving parts are constructed of hardened steel. The pivot points are designed to ensure holding ability and supreme closing force. The person operating it has the capacity to deal with different sizes and varieties of materials due to the jaws built-in at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
